

Employee Attrition Analysis and Prediction

Project Objective : The purpose of this analysis was to understand the factors that contribute to employee attrition and identify employees who may be at risk of leaving the organization.

Key Findings : The analysis revealed that employee attrition is influenced by multiple factors rather than salary alone. Employees with lower job satisfaction, frequent overtime, limited work-life balance, and fewer opportunities for career growth were more likely to leave the organization.

Employees in the early years of their tenure showed a greater tendency to leave, suggesting that onboarding, engagement, and career development efforts during the first few years of employment are particularly important. While compensation remains a contributing factor, workplace experience and employee engagement appeared to have a stronger impact on retention.

Predictive Modeling Results : Several predictive models were developed to identify employees at risk of attrition. The selected model demonstrated a strong ability to distinguish between employees who are likely to stay and those who may leave. These predictions can help HR teams proactively identify high-risk employees and implement targeted interventions before turnover occurs.

Recommendations : Focus retention efforts on departments and job roles with the highest turnover rates.

Monitor employees reporting lower job satisfaction or poor work-life balance and provide support through regular check-ins and engagement programs.

Strengthen career development initiatives, mentorship programs, and internal growth opportunities to improve long-term employee commitment . Review overtime practices and workload distribution to reduce employee burnout and improve overall well-being.

Use predictive analytics as an early-warning system to identify employees who may be considering leaving and engage them proactively.

Conclusion : This analysis highlights that employee attrition is driven by a combination of workplace, compensation, and engagement-related factors. By addressing these areas and focusing on employees most at risk, HR leaders can improve retention, reduce recruitment costs, and build a more stable and productive workforce. The findings provide valuable guidance for developing data-driven employee retention strategies and enhancing overall organizational performance.
